

# SPECTRUM VIEW

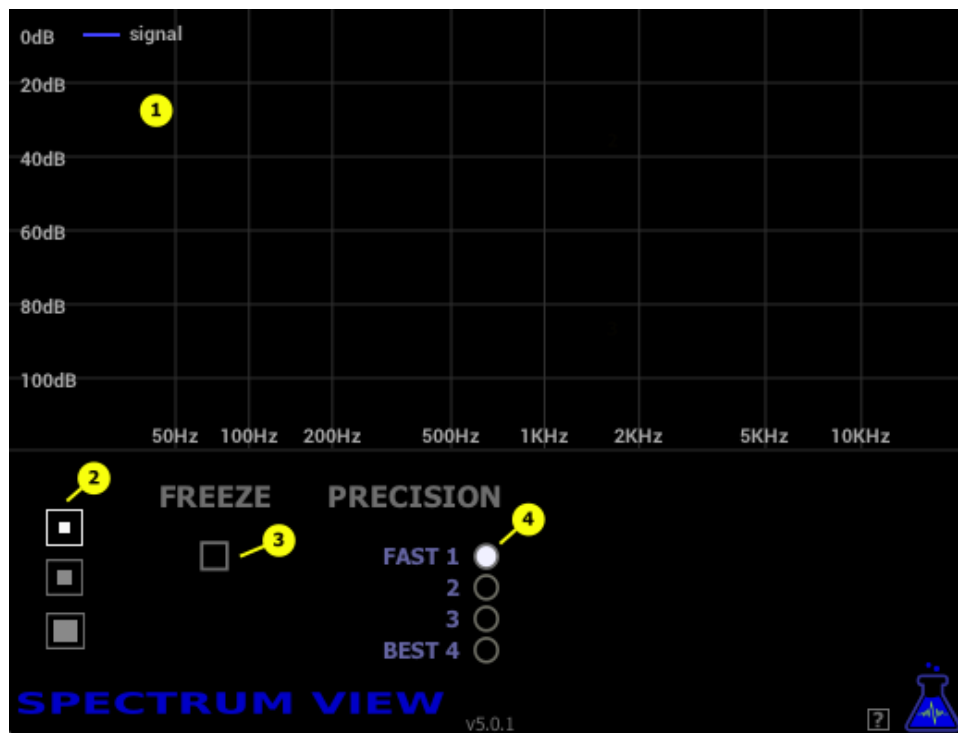

# DESCRIPTION

**SpectrumView** is minimalist spectrum analyzer plugin. It displays the spectrum of a track and provides minimal but interesting features.

# USAGE

The **GRAPH (1)** area displays the spectrum of the track.

The **GUI SIZE (2)** buttons resize the GUI, from small to big. Smaller GUI size is useful to be able to keep the plugin open while working in the DAW, whereas bigger GUI size is useful for inspecting the analysis more accurately.

The **FREEZE (3)** parameter is used to freeze the current displayed spectrum. It enables the possibility to keep the display corresponding to a particular section of sound in order to inspect is better for example.

The **PRECISION (4)** parameter sets the precision of the spectrum analysis, and thus the precision of the curve displayed in the **GRAPH (1)**.

**NOTE:** The plugin needs more CPU resources when increasing the **PRECISION (4)** parameter.
