

BlueLab gain60

DESCRIPTION

Gain60 is a plugin that modifies the gain of a track from -60dB to +60dB.

USAGE

The **GAIN (1)** parameter attenuates or increases the gain from -60dB to +60dB.

EXAMPLE OF USE

We want to modify the level of a track that was recorded with a very low level. Sometimes on this kind of track we do not even see the waveform. We then can use the **Gain60** plugin in “offline” mode (bounce...) and increase in one step the gain of the whole track.

RECOMMENDATION

Be careful to the manipulations with the **Gain60** plugin in “real time” mode ! The volume changes can be large with only a light manipulation of the button. **Be careful at the sound level that can be sent to the hardware, but above all to your ears !**
