

BlueLab sampledelay

DESCRIPTION

SampleDelay is a plugin that simply applies a short delay to a track. It has a precision at the level of one sample. It is more designed to be used as a utility than to be used to make an effect.

EXAMPLES OF USE

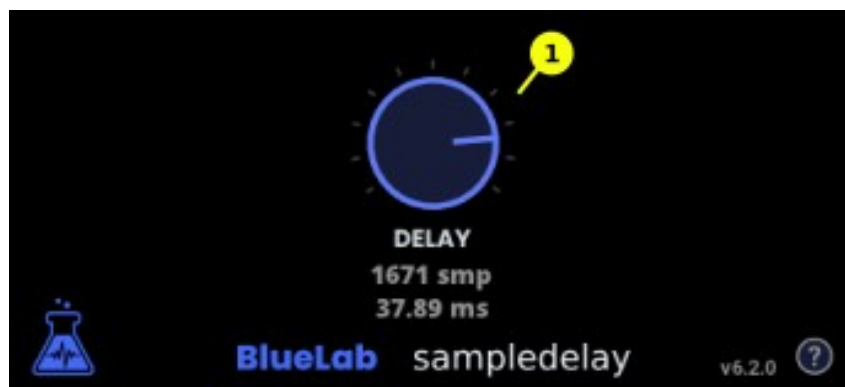

Shifting a track lightly

The plugin can be used to adjust a track that has been accidentally lightly shifted.

Dubbing effect

With this plugin, two tracks can be lightly shifted from one to the other to get a dubbing effect.

USAGE

The **DELAY (1)** parameter sets the value of the delay to apply to a track. The value is displayed in number of samples (smp) from 0 to 2048, and the corresponding value in milliseconds (ms) is also computed and displayed.
