# BlueLab gain24

DESCRIPTION

Gain24 is a plugin that modifies the gain of a track from -24dB to +24dB.

USAGE

The **GAIN (1)** parameter attenuates or increases the gain from -24dB to +24dB.

EXAMPLES OF USE

Modifying the gain without touching the fader
We want to modify the output gain of a track quite significantly, without touching the fader of the track. For example if we can't, because we already have an automation on the fader, or if previous plugins in the chain made the gain decrease, and we want to correct it in a transparent way.

Volume automation
We want to make quite significant volume automation on a track, but we are unable to make the automation on the fader of the track. We will then do an automation on the parameter of the **Gain24** plugin.

Increase the volume in offline mode
We want to increase the level of an audio track which has been recorded with too low level. We can then use the **Gain24** plugin in "offline" mode (bounce...), and increase the gain of the whole track in one step.
