# BlueLab gain12

DESCRIPTION

Gain12 is a plugin that modifies the gain of a track from -12dB to +12dB.

USAGE

The **GAIN (1)** parameter attenuates or increases the gain from -12dB to +12dB.

EXAMPLES OF USE

Modifying the gain without touching the fader
We want to modify the output gain of a track without touching the fader of the track. For example if we can't, because we already have an automation on the fader, or if previous plugins in the chain made the gain decrease, and we want to correct it in a transparent way.

Volume automation
We want to make a volume automation on a track, but we are unable to make the automation on the fader of the track. We can then do an automation on the parameter of the **Gain12** plugin.
Gain12 is particularly adapted to this kind of use, because of his range from -12dB to +12dB, which is not a too large range. Then we will be able to manipulate the automation curve with ease and accuracy.
